Introduction

In this section you are required to present the idea behind your project. A general description of the problem you are solving must be provided. You need to discuss the challenges you will be facing. Also, you need to describe the goals of the project (what you are trying to achieve). The targeted users for your project should be discussed (i.e. the project is oriented toward helping the elderly, college students, terminal patients, etc.).

Background

In this section you are required to provide a brief history of the work you are planning to do. You should provide a description of the algorithms, tools (hardware and software), and development environment you are using to realize your project goals. For example, if your work is cryptography oriented, you need to provide a background for the ciphers you are using or modifying. **Note that all external resources must be cited.**

System Model

Start this section by detailing your problem statement (i.e.; what problem you intend to address and why). Then, explain the proposed system model in details. You are expected to present the steps to be followed in building your system in order to achieve its goals. Your model can be a diagram, a flowchart, or a pseudocode for the procedure you are using. Include the model assumptions, requirements, and constraints.

Completed Tasks

For this section, provide details about the tasks you have completed thus far in your project. Mention the major milestones you have reached and also discuss the limitations that you have faced. Examples of items to be included are building a major project component, successfully running an attack, or implementing a compression algorithm. On the other hand, installing a compiler or downloading a tool are not considered milestones and should not be discussed.

Along with these points, it is necessary to discuss how these steps would lead to the successful completion of the project or how some limitations would have an adverse effect and the methods you have applied or intend to apply to overcome them.

Please adhere to the 3-page limit (excluding the cover page).

References

In this section you are to cite the references you used. You will be using the IEEE format when listing your references. An IEEE citation looks like:

Author(s), "Article title," *Journal Title*, vol., no., page number(s), Month year.

An example of a cited article:

[1] Rabiner, L., "A tutorial on hidden Markov models and selected applications in speech recognition," in *Proceedings of the IEEE* , vol.77, no.2, pp.257-286, Feb 1989.
